

How AI is Quietly changing students life?

Artificial Intelligence created a boom when open AI launched its famous chatbot .

That was a passive paradigm shift that caught the attention of the global population. These chatbot are incredibly conversational. For that they are used by the people belonging from different fields: Teacher, doctor, engineer, parents, and including students etc. for students it acts as an always-available personal tutor _ but it also opens the door to easy plagiarism.

Historically, students would search for information about any topic in books, and ask from Google manually. What now then? They can ask anything from their favourite chatbots while having instant replies. For those who want to just randomly pass their test, assignments and so on. They imitate word-by-word from their favourite chatbots. Without realising it, they are eroding their own creativity and thinking skills.

Untimely, there are such students who just try to gain Knowledge and gather information about whatever they are looking for. Then they utilize their brain with the combination of Knowledge from the bot to successfully complete their project.

Ultimately, AI is the modern and effective technology that is progressing so fast. One must learn how to use AI for their best interests. They had better understand how to command the chatbots for better outcomes.

Previously, everything was physical such as:

- . Breaking down social anxiety (asking "stupid" questions instead of raising a hand in class).
- . Overcoming the "blank page syndrome" when trying to start an essay
- . Personalized learning pacing for students who learn differently.
